2	A method and apparatus for monitoring the capacity of a valve regulated lead acid battery
3	comprising at least one battery monitor connected to the valve regulated lead acid battery; a
4	centralized system connecting the battery monitor through an industry standard data system to a
5	central office; and an alarm connected to the centralized system; wherein, a short-term discharge
6	test is performed on the battery using the battery monitor which provides input parameters for a
7	neural network and fuzzy logic network used in combination with a prediction algorithm to
8	calculate the predicted capacity; and, wherein, the alarm is activated when said predicted capacity
9	falls below eighty percent, when an individual cell voltage is reduced to 1.95 volts or less, or when
10	a system failure occurs
